

Day 4

Here are clean notes you can keep for opening a repo in VS Code and using basic Git commands.

Open a repo in VS Code

1. Open VS Code.
2. Open the folder that contains your project using **File > Open Folder**.
3. If the repo is already on your computer, you can also open it from the terminal with:
 - `code <folder-name>`
4. If the repo is on GitHub and you want to clone it first, copy the repo URL and run:
 - `git clone <repo-url>`
5. After cloning, open the cloned folder in VS Code.

Git commands

`git status`

Shows the current state of your repo.

- Which files are modified.
- Which files are staged.
- Which files are untracked.

Example:

```
git status
```

`git clone <repo-url>`

Creates a local copy of a remote repository.

Example:

```
git clone https://github.com/user/repo.git
```

git add

Adds files to the staging area, so Git knows what to include in the next commit.

Add one file:

```
git add file.txt
```

Add all files:

```
git add .
```

git commit -m "message"

Saves staged changes with a commit message.

Example:

```
git commit -m "Added login page"
```

git push

Uploads your committed changes to the remote repository.

Example:

```
git push
```

Common workflow

1. Clone the repo:

```
git clone <repo-url>
```

Note: copy the SSH URL of your repo , as we are using SSH connection

1. Move into the folder:

```
cd <repo-name>
```

1. Check changes:

```
git status
```

1. Stage changes:

```
git add .
```

1. Commit changes:

```
git commit -m "your message"
```

1. Push changes:

```
git push
```

Short version

- `git status` = check current changes.
- `git clone` = copy a repo to your machine.
- `git add` = stage files.
- `git commit -m` = save staged files with a message.
- `git push` = upload commits to remote.
